

# MycoSolutions

*inspired by nature*

## Prevention of fungal infestation

Stimulation of messenger substances (jasmonic acid, salicylic acid, etc.) leads to the activation of phytoalexins (plant antibodies), mycoparasitism breaks down hyphae of harmful fungi.

## Increased availability of nutrients

Phosphates, iron and micronutrients are made available to the plant by being more easily absorbed from the soil.

## Growth booster

Production of auxins (e.g. indole-3-acetic acid) transported through the plant via the roots, leads to increased root and shoot growth.

## Humus formation

Helps the conversation of dead organic substances into humus.

## Healthier soil biology

Symbiosis with other beneficial organisms, e.g. mycorrhizae, supports nitrogen fixing bacteria and nodulation.

**BioControl Agent Avengelus**

**For:**  
**trees,**  
**ornamental plants,**  
**crops,**  
**turf**

(200 ml and 500 ml packs)
